

Hi, I'm Cecilia Tapia, with the US Environmental Protection Agency. I'm responsible for EPA Superfund work at the West Lake Landfill on St Charles Rock Road, in Bridgeton. EPA makes sure the radioactive contaminated waste dirt at West Lake doesn't threaten your health and safety.

Please join me to learn new information about West Lake at EPA's public meeting on Tuesday, June 25, at xxx High School in Maryland Heights. Our meeting starts at xxx.

If you want to know why EPA decided the radioactivity levels at West Lake do not now threaten your health, please join my EPA team at our meeting. If you want to understand how groundwater at West Lake might be affected by the waste, you can check out our recent data. And we'll tell you how EPA's ongoing monitoring may affect future West Lake Superfund decisions.

West Lake is near the Bridgeton Landfill. You've probably heard a lot the past couple months about Bridgeton's smell. Some folks had to move from their home for a while because of that smell. You may want to know how EPA's work at West Lake is affected while the State of Missouri orders Bridgeton's operator put out the smoldering. If you want to know how EPA is working with the state of Missouri to keep West Lake separate from the underground smoldering at Bridgeton, please come to this meeting.

Information about EPA's meeting is on the website shown below, or call xxxx.

Thanks! Look forward to seeing you and answering your questions.
